Scenario ID and Given Prompt: Scenario #4 – Role Based Access Control - "Write test cases for user roles."

What is missing in the given prompt:

- Clear context on project requirements
- a proper set of instructions
- how the model should act as when performing the required task

Weak Prompt Output from Copilot:

Test Case ID	Role	Test Case Description	Test Steps	Expected Result	Preconditions
TC_RBAC_001	Admin	Verify Admin can create new users	Login as Admin → Navigate to User Management → Create new user	User created successfully, confirmation message displayed	Admin account exists
TC_RBAC_002	Admin	Verify Admin can delete users	Login as Admin → Navigate to User Management → Delete existing user	User deleted successfully, confirmation message displayed	User exists in system
TC_RBAC_003	Manager	Verify Manager cannot delete users	Login as Manager → Navigate to User Manage	System displays “Access Denied” or	Manager account exists

			ment → Attempt to delete user	option disabled	
TC_RBAC_004	Manager	Verify Manager can view reports	Login as Manager → Navigate to Reports → Open monthly report	Report displayed successfully	Reports exist
TC_RBAC_005	User	Verify User can update own profile	Login as User → Navigate to Profile → Edit details → Save	Profile updated successfully	User account exists
TC_RBAC_006	User	Verify User cannot access Admin dashboard	Login as User → Attempt to access Admin dashboard URL	Access denied / redirected to error page	User account exists
TC_RBAC_007	Guest	Verify Guest can only view public pages	Login as Guest → Navigate to public page	Page displayed successfully	Guest account exists
TC_RBAC_008	Guest	Verify Guest cannot access	Login as Guest → Attempt to	Access denied	Guest account exists

		private data	access private report		
TC_RBAC_009	All Roles	Verify password change functionality	Login → Navigate to Change Password → Enter old/new password → Save	Password updated successfully	Valid account exists
TC_RBAC_010	All Roles	Verify session timeout	Login → Stay idle for configured timeout duration	System logs out automatically	Timeout configured

These cover **positive, negative, and edge cases** for role-based access. If you want, I can also expand this into **API-level test cases** (e.g., verifying role-based access via REST calls) or **automation-ready scenarios** in Playwright/Selenium format.

Would you like me to tailor these test cases specifically for **QA applications (like ServiceNow, Gloss, or BTUF)** that you've been practicing on, so they feel closer to your domain?

Rewritten ICEPOT prompt output from Copilot:

Here's a professional QA-style table of **positive, negative, and edge test cases** for the hospital portal's **user roles functionality**.

🧪 **User Roles Test Cases**

Scenario ID	Scenario Description	Prerequisite	Test Data	Test Steps	Expected Results
TC_ROLE_POS_001	Verify Admin can create a	Admin credentials available	Patient details (Name, DOB,	Login as Admin → Navigate to Create	Patient ID generated

Scenario ID	Scenario Description	Prerequisite	Test Data	Test Steps	Expected Results
	new patient record		Phone, Email, Blood Group, Comorbidity, Treatment Reason, Doctor Name)	Patient → Fill all fields → Submit	successfully, record saved
TC_ROLE_POS_002	Verify Receptionist can create a new patient record	Receptionist credentials available	Patient details	Login as Receptionist → Create Patient → Fill all fields → Submit	Patient ID generated successfully, record saved
TC_ROLE_POS_003	Verify Registered Patient can update phone/email only	Registered Patient credentials available	Patient ID, new phone/email	Login as Patient → Navigate to Update → Change phone/email → Save	Phone/email updated successfully
TC_ROLE_POS_004	Verify Doctor can read patient record	Doctor credentials available	Patient ID	Login as Doctor → Enter Patient ID → View record	Patient record displayed
TC_ROLE_POS_005	Verify Unregistered Patient can view unregistered patient message	No patient credentials	Invalid Patient ID	Attempt login with invalid patient ID	System displays “Unregistered Patient” message

Scenario ID	Scenario Description	Prerequisite	Test Data	Test Steps	Expected Results
TC_ROLE_NEG_001	Receptionist attempts to delete patient record	Receptionist credentials available	Patient ID	Login as Receptionist → Attempt Delete	Access restricted alert shown, email sent to Admin
TC_ROLE_NEG_002	Registered Patient attempts to update DOB	Registered Patient credentials available	Patient ID, new DOB	Login as Patient → Attempt to update DOB → Save	Access restricted alert shown, email sent to Admin
TC_ROLE_NEG_003	Doctor attempts to create patient record	Doctor credentials available	Patient details	Login as Doctor → Attempt Create Patient	Access restricted alert shown, email sent to Admin
TC_ROLE_NEG_004	Guest/Unregistered Patient attempts to read patient record	Invalid patient credentials	Patient ID	Login with invalid credentials → Attempt Read	Access restricted alert shown, email sent to Admin
TC_ROLE_NEG_005	User enters wrong password	Any role credentials	Invalid password	Login attempt with wrong password	Login fails, error message displayed

Scenario ID	Scenario Description	Prerequisite	Test Data	Test Steps	Expected Results
TC_ROLE_EDGE_001	Verify Admin can update all fields including edge values	Admin credentials available	Patient ID, extreme values (e.g., very long name, unusual blood group entry)	Login as Admin → Update patient record with edge values → Save	System accepts valid edge values, rejects invalid ones
TC_ROLE_EDGE_002	Receptionist attempts to create patient record with missing mandatory field	Receptionist credentials available	Patient details missing DOB	Login as Receptionist → Create Patient → Leave DOB blank → Submit	System displays validation error, record not created
TC_ROLE_EDGE_003	Registered Patient attempts to update phone with invalid format	Registered Patient credentials available	Patient ID, invalid phone (e.g., alphabets)	Login as Patient → Update phone → Save	System rejects invalid phone format, error message displayed
TC_ROLE_EDGE_004	Doctor attempts to read patient record with invalid Patient ID	Doctor credentials available	Invalid Patient ID	Login as Doctor → Enter invalid Patient ID → Search	System displays “Patient not found”
TC_ROLE_EDGE_005	Session timeout for inactive user	Any role credentials	Valid login	Login → Stay idle beyond timeout	System logs out automatically, user

Scenario ID	Scenario Description	Prerequisite	Test Data	Test Steps	Expected Results
					redirected to login page

✅ This covers **positive (valid actions), negative (restricted actions), and edge (boundary conditions)** across all user roles. 👉 If you'd like, I can also extend this into **automation-ready scenarios** (e.g., Selenium/Playwright scripts) or **API-level test cases** for CRUD operations on patient records.

Would you like me to **map these test cases into automation scripts** (say, Playwright or REST Assured) so they're directly usable in your QA practice?

Observations on Improvements seen:

The ICEPOT prompt helped the user to get the desired test cases with respect to what he/she wants to test (functional testing here) but the weak prompt fetched a vast test coverage with all types of possible testing which might not be needed for the user. Also this technique helped to get the test cases for the exact module or app what they wanted to test for whereas the weak prompt showed generic test cases as there was no context or other details given in prompt.
